

Ideation Phase
Empathize & Discover

Date	31 January 2025
Team ID	HDI Predictor Team
Project Name	HDI Predictor using Machine Learning and Flask
Maximum Marks	4 Marks

Empathy Map Canvas:

An empathy map for the HDI Predictor captures what a student or reviewer thinks, sees, says, does, and needs when comparing country development indicators.

It helps the project focus on a simple browser-based prediction flow with clear input, output, and visual explanation.

Creating an effective solution requires understanding the user who wants a quick and reliable HDI estimate from measurable data.

Example:

Gain: A browser-based workflow that shows HDI score, category, confidence, and visual explanation.

Pain: Manual comparison across multiple years and columns takes time and reduces convenience.

Hear: The user hears that the model is trained on real country indicators and should respond consistently.

Say & Do: The user selects a country, enters indicator values, uploads a CSV file, and reviews the prediction output.

See: The user sees country indicators, cleaned dataset values, charts, and a structured result page.

Think & Feel: The user wants a quick and reliable HDI estimate and expects the system to be easy to understand.

Empathy Map
